

# catch the wave

GuestCentrix Web Reservations Systems provides a real-time, two-way interface for accommodation bookings for the PMS. An XML interface provides multiple services such as rate availability, accommodation availability and reservation entry and automatic confirmation.

## WEB RESERVATIONS SYSTEM FEATURES

From the hotel website, clients select the 'Online Reservation' link, then choose reservation dates, room type and enter personal details including credit card number. An optional Payment Gateway function is available which will redirect the webpage to a credit card authorization company for payment. Once complete, the reservation is automatically updated in the hotel database, and a deposit is posted to the guest account. The client receives a confirmation email, as does the hotel.

The system uses standard web technologies to deliver a system that is simple to implement, easy to maintain, reliable and easy to use.

- Can integrate within users existing web site pages
- Does not require manual updating of availability for web bookings
- Automatic e-mail confirmation for guests upon booking completion
- Real-time booking interface
- Real-time availability enquiry for rate and accommodation
- Optional Payment Gateway
